BLANKING**

Introducing UniPunch tooling for metal blanking, the process of cutting a desired shape out of a flat piece of sheet metal. Our tooling is ideal for punch slug applications and ensures precise hole sizing - on the entry side, the hole is the size of the punch, and on the other side, it matches the die. For accurate blank sizing, we undersize the punch and make the blanking die to size, providing appropriate punch and die clearance. Additionally, the punch is supplied without shear to maintain blank flatness. Trust UniPunch for your metal blanking needs.

- Custom turn-key systems for progressive blanking including the mounting system and gauging.
- Compared to a die set, UniPunch tooling is a lower cost alternative for blanking small parts or blanking and punching in the same operation.
